ALIGNMENTS

AAQ91121-Q91130 are nested PCR primers used for the amplification and identification of beta-cardiac myosin heavy-chain RNA. They are used in a new non-invasive method for diagnosing hypertrophic cardiomyopathy (HC), the method involves detecting the presence or absence of specific HC-associated mutations in the beta-cardiac myosin heavy-chain obtained from a blood sample. The method may be used to diagnose familial or sporadic HC and the non-invasive method is particularly important when testing Non-invasive method for diagnosis of hypertrophic cardio-myopathy useful for testing asymptomatic individual(s). The mutations associated with SHC/FHC are detected in the myosin gene isolated from blood, by detecting mis-matched areas in RNA-DNA hybrid double strands (RNA from the normal gene, DNA from the suspect asample). FHC associated point mutation can be classified and used to determine life expectancy in affected individuals e.g. using a Kaplan-Meier curve for the classified type of FHC causing point mutation. Also included are an RNA probe comprising ribonucleotides arranged in a sequence which is complementary to at least a portion of beta-cardiac myosin heavy-chain DNA and a set of DNA oligonucleotide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two
asymptomatic individuals suspected of having the disease. The method has be broad applicability and may be used to detect mutations responsible for other genetically inheritable diseases e.g. cystic fibrosis, Gaucher's disease, haemophilia A and B, Duchenne's muscular dystrophy, sickle cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     familial hypertrophic cardiomyopathy; SHC; Gaucher's disease; sporadic hypertrophic cardiomyopathy; life expectancy; haemophilia; Duchenne's muscular dystrophy; sickle cell anaemia; Tay-Sachs disease; phenylketonuria; cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting a presence or absence of a mutation associated with hypertrophic cardiomypathy, useful for diagnosing cystic fibrosis or hemophilia, by detecting a mutation in an amplified product of a beta cardiac myosin heavy-chain DNA.
                                                                                                                                                                                               Gaps
                                                                                                                                                                                               ;

         DNA. The method is useful for detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy. This method is especially useful for diagnosing SHC and FHC, as well as for determining the estimated the life expectancy of a person with familial hypertrophic cardiomyopathy. In particular, the method is useful for determining an individual's genetic information, and diagnosing e.g. Gaucher's disease, haemophilia, undennes muscular dystrophy, sickle cell ansemia, Tay-Sachs disease, phenylketonuria or dystrophy, sickle cell ansemia, Tay-cath of primer used to amplify a region of the beta cardiac myosin heavy chain cDNA containing an FHC-associated mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting mutations associated with hypertrophic cardiomyopathy to diagnose hypertrophic cardiomyopathy, comprises amplifying beta-cardiac myosin heavy-chain DNA and detecting the mutation in the amplified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    amplified product, and detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy in the amplified product, thus, facilitating the diagnosis of hypertrophic cardiomyopathy. Also included are a set of DNA oligomuclectide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two oligomucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to detecting the presence or absence of a mutatio associated with hypertrophic cardiomyopathy (familial or sporadic, FHC, SHC) for facilitating the diagnosis of hypertrophic cardiomyopathy, comprising amplifying beta-cardiac myosin heavy-chain DNA forming an

cc which amplify beta-cardiac myosin heavy-chain DNA (the set of cligonuclectide primers being useful for facilitating the diagnosis of hypertrophic cardiomyopathy being capable of detecting a hypertrophic cardiomyopathy (comprising the diagnosis of hypertrophic cardiomyopathy (comprising a first container holding an RNA probe completely hybridisable to the beta-cardiac myosin heavy chain DNA, where the RNA probe is capable of detecting a chaptrophic cardiomyopathy associated mutation, a second container of pretricions for uspilitying beta-cardiac myosin heavy-chain DNA and instructions for uspilitying beta-cardiac myosin heavy-chain DNA). The method is used for amplified beta-cardiac myosin heavy-chain DNA). The method is used for cardiomyopathy for facilitating the diagnosis of individuals cardiomyopathy. Presently, the diagnosis of individuals cardiomyopathy. Presently, the diagnosis of individuals cardiomyopathy. Presently, the diagnosis of individuals cardiomyopathy relies on the presence of typical clinical symptoms and the demonstration of unexplained ventricular companions of part, on the discovery that hypertrophic cardiomyopathy relies on the presence of typical chypertrophy. The present invention is non-invasive and based, at least in the beta actaiac myosin heavy-chain gene. Prior art creveals that there are no extensive studies involving a large number of families which established that this particular disease or disorder was caused by point mutations in the beta cardiac myosin heavy-chain gene. The present sequence is a PCR primer used to amplify a region of the beta cardiac myosin heavy-chain gene. The present sequence is a PCR primer used to amplify a region of the beta cardiac myosin heavy-chain gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cardiac myosin heavy chain having a disease-related point mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 25 BP; 8 A; 5 C; 7 G; 5 T; 0 U; 0 Other;

Human reductase nucleotide 9 and encoded polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and inflammation

```
The invention relates to human nucleotide reductase 9 (AAMS2683), nucleic acids encoding it (ABA02159), and a method for the recombinant production of nucleotide reductase 9. The protein has a molecular weight of 9 kD. The present invention additionally discloses an antagonist of nucleotide reductase 9 for therapeutic use, and an antibody which specifically binds to nucleotide reductase 9. Nucleotide reductase 9, and nucleotides which encode it may be used for treating a variety of diseases, such as malignant tumours, blood diseases, HIV (human immunodeficiency virus) infection, immune disorders, inflammatory conditions, disorders of purine and pyrimidine metabolism, and embryonic and growth disorders. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polynucleotide can be used as a primer for nucleic acid amplification reactions or as a probe for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hybridisation reactions, or in producing gene chips or microarrays.
Sequences ABA02364-ABA02365 represent human nucleotide reductase 9 probes

Genes and proteins participating in neutralization of cells or tissues, useful in gene therapy and regeneration medicine, applicable in diagnosis, drug development for neural diseases and study of mechanism of pathosis.

Example 1; SEQ ID NO 6; 101pp; Japanese.

The invention relates to a method for inducing neutralisation of cells or tissues by using a protein binding to CRAM (collapsing-response mediator protein-associated molecule) protein or its encoded gene. The proteins and their encoded genes are useful in gene therapy and regenerative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is an example of nucleic acid probes of the invention. The probe may be doubly labelled with non-identical covalently attached dyes, i.e. thiazele orange and MDC. A bifunctional branched linker is used to attach the dyes to the oligonucleotide. The probe generates a fluorescent signal upon hybridisation to a complementary nucleic acid based on the interaction of an intercalator or DNA groove binder with the formed double-stranded DNA. Nucleic acid probes of the invention can be used in homogeneous assays, real-time PCR monitoring, transcription assays, expression analysis on nucleic acid microarrays and other microarray applications such as genotyping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detection or quantification of nucleic acid analyte, by hybridizing a nucleic acid probe having non-identical covalently attached dyes, with nucleic acid analyte, and measuring change in fluorescence of the probes.
medicine, e.g. by inducing neutralisation of mitochondria. They are also applicable in diagnosis, drug development for neural diseases and studying the mechanism of pathosis. The current sequence represents CRAM protein related PCR primer sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present sequence is an example of nucleic acid probes of the invention. The probe may be doubly labelled with non-identical covalently attached dyes, i.e. thiazole orange and MDCC. A bifunctional branched linker is used to attach the dyes to the oligonucleotide. The probe generates a fluorescent signal upon hybridisation to a complementary nucleic acid based on the interaction of an intercalator or DNA groove binder with the formed double-stranded DNA. Nucleic acid probes of the invention can be used in homogeneous assays, real-time PCR monitoring, transcription assays, expression analysis on nucleic acid microarrays and other microarray applications such as genotyping
Detection or quantification of nucleic acid analyte, by hybridizing a nucleic acid probe having non-identical covalently attached dyes, with nucleic acid analyte, and measuring change in fluorescence of the probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Human zinc finger protein 33.22, encoding polynucleotide, antagonist and recombinant preparation, useful for treating tumors and diabetes.
                                                                                                                                                                                                                                                                                                                          The invention describes a human zinc finger protein -33.22, encoding polynucleotide, antagonist, and recombinant preparation. This sequence represents a PCR primer used to amplify DNA encoding the human zinc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a human zinc finger protein -33.22, encoding polymuclectide, antagonist, and recombinant preparation. This sequence represents a probe used to detect DNA encoding the human zinc finger protein 33.22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human zinc finger protein 33.22, encoding polynucleotide, antagor
recombinant preparation, useful for treating tumors and diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        59.2%; Score 14.8; DB 8; Length 33; 88.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, an analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises comprises and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid components of a gene and a cross-species comparises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the cucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific cucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific cucleic acids further comprises a tag sequence. The array of nucleic acid for any gene, in mapping the 5' termin of mRNA molecules by companions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the form inspro are analso be obtained in electronic format directly from tisput a marcher analso be obtained.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           59.2%; Score 14.8; DB 9; Length 25; 88.9%; Pred. ```
New oligonucleotide probe species-specific to a Bacteroides group microbe - useful for identification of the microbe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel pharmaceutical composition that comprises a bacteriolytic gene derived from a bacteriophage.

Specifically, it refers to a bacteriophage chosen from a levi virus of the Leviviridae family, which is a small globular form RNA phage or a micro virus of the Microviridae family, which is a small globular form ENA phage. The bacteriolytic gene in the construct is under the control of a phage lambda lactose promoter, and further contains a gene encoding a coat protein as well as an inducer of gene expression i.e. isopropyl beta-D-1 thio-galactopyranoside (IPTG). The present invention describes a composition useful for treating infectious disease through the bacteriolysis of bacteria such as Escherichia coli infections occurring in both humans and animals. Furthermore, it is a highly reliable, safe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pharmaceutical composition useful for treating infectious diseases, comprises gene construct containing bacteriolytic gene of bacteriophage, and carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAXS9976-93 represents oligonucleotide probes that are species-specific Bacteroides group microbes. The probes are useful for species-specific identification of a Bacteroides group microbe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR primer SP-23 to amplify B-IV group phage bacteriolysis gene Seq 11.

The present invention describes a method (M) for determining the ion channel disease genotype of an individual. Also described: (1) an isolated KXONG1 nucleic acid molecule (I) comprising a sequence (S1, see ACC41977 to ACC41980), or a nucleic acid sequence that is fully complementary to S1, where the isolated nucleic acid molecule is less than 5 kilobases in length; (2) an array of oligonucleotides comprising (I); and (3) an isolated nucleic acid molecule (II) comprising at least one base variation from that of an ion channel associated gene sequence comprising a polymorphic nucleotide identified in Tables 4 and 5 in the specification, with the polymorphic nucleotide, where the isolated nucleic acid molecule is less than about 5 kilobases in length. (M) is nucleic acid molecule is less than about 5 kilobases in length. (M) is useful for determining ion channel disease genotype of an individual, where the individual has or is suspected of having an ion channel disease selected from long QT syndrome, cardiac arrhythmias, epilepsy, hearing
                                                                                                                                                                                ö
specific antimicrobial method for targeting pathogenic bacteria and nuse it does not comprise a medical agent it also prevents the risk of erating drug-resistant microbes. This oligonucleotide sequence is a primer given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            decreased ion

Also determining the presence of a toxic response to the agent. Also from the genes corresponding to the partial sequences given in ABZB2842 to ABZ84764, or their fragments of at least 20 nucleotides, or homologues is and (2) determining if a gene putatively identified to be a toxic response gene plays a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Determining a toxicological response to an agent, useful for screening of drugs, comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of
               epilepsy (SUDEP), sudden unexpected death in sleep (SUDS), post-
myocardial infarction complications, and acquired sudden death syndrome,
or the individual is a lineal descendant of an individual who has or is
suspected of having the above diseases. (II) is useful for conducting
clinical trials of drug candidates for ion channel diseases, for
preparing probes or primers for detection of the presence of long OT
genes, and for establishing physical linkage between a genetic locus
associated with a trait of interest and polymorphic markers that are not
locus responsible for the trait of or establishing physical proximity with the genetic
locus responsible for the trait of sequences used in the
ACC42159, ABP96320 and ABP96321 represent sequences used in the
exemplification of the present invention

ö
to a known toxic pharmaceutical or industrial agent, comprising: (a) exposing cells to an agent or isolating cells from a human subject who was exposed to an agent; (b) obtaining the test gene expression profile for a putatively identified toxic response gene after exposure to a known toxic pharmaceutical or industrial agent; and (c) comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of the agene with a similar function or exposure to other known toxic compounds. The methods are useful for predicting and determining toxicological responses on a cellular, organ or system level. The arrays comprising the human genes are useful for toxicological screening of drugs, pharmaceutical compounds and chemicals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a variant of bovine pancreatic desoxyribonuclease I (pancreatic DNase I), by way of amino acid substituted substituted, where at least one different amino acid substitutes for an amino acid residue chosen from Cys173, Cys101, Cys104, Lys117, Arg185, Arg187, I183, Phe82, and Phe128. Bovine pancreatic DNase I is useful for hydrolyzing DNA and subsequently reducing the specific desoxyribonuclease activity of the variant of the enzyme to approximately zero units per mg of procein. The present sequence is a mutagenic primer used to alter the wild-type bovine pancreatic DNase I coding sequence.
                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Variant of bovine pancreatic desoxyribonuclease I produced by spe
amino acid substitutions in bovine pancreatic desoxyribonuclease
increased thermolability and is useful for hydrolyzing DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a variant of bovine pancreatic desoxyribonuclease I (pancreatic DNase I), by way of amino acid substitution, where at least one different amino acid substitutes for an amino acid residue chosen from Cys173, Cys101, Cys104, Lys117, Arg185, Arg187, I1e3, Phe82, and Phe128. Bovine pancreatic DNase I is useful for hydrolyzing DNA and subsequently reducing the specific desoxyribonuclease activity of the variant of the enzyme to approximately zero units per mg of protein. The present sequence is a mutagenic primer used to alter the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Variant of bovine pancreatic desoxyribonuclease I produced by specific amino acid substitutions in bovine pancreatic desoxyribonuclease I, has increased thermolability and is useful for hydrolyzing DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                           Gaps

Human microarray DNA oligonucleotide SEQ ID NO 31963,

13-OCT-2003 (first entry)

```
The invention relates to human nucleotide reductase 9 (AAMS2683), nucleic acids encoding it (ABA02359), and a method for the recombinant production acids encoding it (ABA02359), and a method for the recombinant production of nucleotide reductase 9. The protein has a molecular weight of 9 kD.

The present invention additionally discloses an antigonist of nucleotide reductase 9 for therapeutic use, and an antibody which specifically binds to nucleotide reductase 9, and nucleotides which encode it may be used for treating a variety of diseases, such as malignant tumours, blood diseases, HIV (human immunodeficiancy virus) infection, immune disorders, inflammatory conditions, disorders of purine and pyrimidine metabolism, and embryonic and growth disorders. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polynucleotide can be used as primer for nucleic acid amplification reactions or as a probe for hybridisation reactions, or in producing gene chips or microarrays. Sequences ABA02364-ABA02365 represent human nucleotide reductase 9 probes
                                                                                                                                                                     Human, nucleotide reductase 9; recombinant production; malignant tumour; cancer; blood disease; HIV infection; human immunodeficiency virus; immune disorder; inflammatory condition; purine; pyrimidine; metabolism disorder; embryonic disorder; growth disorder; gene therapy; cytostatic, anti-HIV; antiinflammatory; immunomodulator; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human reductase nucleotide 9 and encoded polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            or family members of a gene and a cross-species comparison. Each of the mucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening CDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the mucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018 500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  genes that are differentially expressed in peripheral blood samples isolated at different stages of progression, development or treatment of RCC and/or other solid tumors. This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having in the peripheral blood sample to reference expression profile of specific genes in the peripheral blood sample to reference expression profile of the blood mononuclear cells (PBMCs) of patients having the disease as compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from the conditional RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample (claimed). (M1) is useful for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Trepicchio WL, Dorner A, Stover JA;
Renal cell carcinoma differentially expressed gene probe #462.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      56.8%; Score 14.2; DB 12;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes in the peripheral blood sample to reference expressed in peripheral compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample is a whole blood sample (claimed). (M1) is useful for identifying genes that are differentially expressed in peripheral blood samples isolated at different stages of progression, development or treatment of RCC and/or other solid tumors. This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

                                                                                                                                                                                                                                                                                                                    Nucleic acid sequences derived from polypeptide fragments of Candida albicans saccharopine dehydrogenase and which are conserved in fungi can be used as probes and primers in methods for detecting fungal pathogens. They may be used for the detection of C. albicans, Yarrowia lipolytica, and Cryptococcus neoformans. They mays also be used for the detection of Aspergillus fumigatus and Histoplasma capsulatum, especially in patients suffering from AIDS, those under treatment with immunosuppressive drugs, postoperative patients and other immunocompromised patients. The nucleic acid sequences are described in AAT31079-T31093. The peptide epitopes from which they are derived are described in AAW00483-W00495
                                                                                                                                                                                                                                                      Detecting fungal infection by detection of saccharopine dehydrogenase gene - uses probe, primer or antibody specific to conserved Candida albicans sequences as detection agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

This invention relates to a novel method for obtaining a DNA that encodes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a peptide acting as agonist, antagonist or inverse agonist on a target receptor. Specifically, it comprises transformation of endocrine cell lines originating from mammalian hypothalamus and pancreatic islets, culturing the transformants and contacting with cells expressing the target receptor. The identification of those cells with a response reaction can be used for selecting a transformant cell line with the appropriate target activity that is expressing the novel transformed DNA. Accordingly, the present invention describes novel cell lines that are applicable in expression cloning systems of bioactive peptide precursor. Genes, and in screening GPCR ligands for use as drugs including agonists antagonists and inverse agonists i.e. activators and inhibitors. Such cell lines can provide a highly sensitive and convenient GPCR ligand assay system. This oligonucleotide sequence is a PCR primer used to amplify human GPCR DNA of the invention.
                                                                                                                                                                                                                                                                                                        pancreatic islet, applicable in expression cloning systems of bioactive peptide precursor genes, and in screening G protein-coupled receptor ligands.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   confer herbicide resistance activity. Crop plants, such as soybean, cotton, tobacco, sugarbeet, oilseed rape, canola, flax, sunflower, cotton, tobacco, sugarbeet, oilseed rape, canola, flax, sunflower, barley, oat, turf grass, forage grass, sugar cane, pea, field bean, rice, pine, poplar, apple, grape, citrus or nut plants, transformed with a pine, poplar, apple, grape, citrus or nut plants, transformed with a constructed binding protein gene are resistant to the herbicide. Hence, weeds can be selectively controlled in a field of the transformed crops. The plants are substantially resistant or tolerant to herbicides, such as paraquat or diquat, that inhibit photosynthesis by accepting electrons from photosystem I thus generating free radicals which cause lipid peroxidation or by blocking electron transport in photosystem II. The herbicide binding proteins advantageously sequester the herbicide, e.g. at the cell surface or in the vacuoles of a treated plant. Sequestration at the cell surface prevents the entry of the herbicide into the cell so that the herbicide cannot reach its intracellular target and exert any significant cytotoxic effect. The herbicide binding protein inhibits the
                                                                                                                                                                             ö
                                                   present invention relates to cell division cycle regulatory protein 7.17 (see ABP59091). The protein can be used for treating diseases such diabetes and tumours. The present sequence is a probe, which was used

The invention relates to amplifying an unknown region that flanks a known region of a cancer-associated DNA sequence comprising providing a cemplate polywincleotide, ligating a loop-forming oligonucleotide to the cemplate polywincleotide, ligating a loop-forming oligonucleotide to the care strand, annealing the loop-forming oligonucleotide to the sense strand, annealing the loop-forming oligonucleotide to the panamadia structure to extension, and subjecting the panamadia structure to proving the persence of a first primer homologous to the second portion, where the unknown region is amplified. In the method of cancer-associated DNA sequence, the template polynucleotide comprises a sense strand, comprising the known and unknown regions. The unknown region is comprises a first or second portion. The first portion is captured than is the second portion. The loop-forming oligonucleotide is complementary to the first portion. The third region

complementary to the second portion is generated at the free end of the loop-forming oligonucleotide. The cancer-associated DNA sequence comprises AFPI (not defined) or BCR (B cell receptor). The method is useful for amplifying an unknown region that flanks a known region of a cancer-associated DNA sequence. Also disclosed as new is the use of the method in the analysis of the breakpoint region of the human MLL gene, where the chromosomal breaks results in gene fusions with AF-4, CDK-6 and SBPTIN6 and are associated with ALL and AML (acute lymphoblastic leukaemia and acute myeloid leukaemia). MLL is located on chromosome 11q23. The present sequence is an MLL breakpoint junction region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a system for detecting gene expression, which gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                T7; leukocyte; gene expression profiling; allograft rejection; atherosclerosis; congestive heart failure; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Phillips J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

The present sequence represents an oligonucleotide used in an example of the present invention. The present invention describes a method for synthesising a selected oligonucleotide (1) having well defined ends. The method comprises: (a) annealing a primer to a single-stranded (ss) circular template to yield a primed circular template, where the template comprises: (i) at least one nucleotide sequence complementary to (1); and (ii) at least one nucleotide effective to produce a cleavage site in the oligonucleotide multimer; (b) combining the primed circular template with at least two types of nucleotide triphosphates and a polymerase enzyme without the addition of auxiliary proteins to yield a ss oligonucleotide multimer complementary to the circular oligonucleotide template,
                                                                                           A nucleic acid-immobilized array useful for detection of a target nucleic
                                                                                                                                                                                                      The invention relates to a novel nucleic acid-immobilised array in which nucleic acids are lined up and immobilised in a predetermined region on a carrier surface and at least two nucleic acids having base sequences at different sites of a same gene are immobilised at a same position. The method of the invention is useful for the preparation of a nucleic acidimmobilised array. The sequences shown in Abili0976-Abili152 represent probes and PCR primers used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rolling circle synthesis of oligo:nucleotide(s) - using primed circular template to produce oligonucleotide multimer for cleavage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthesis, selection, amplification; circular oligonucleotide, rolling circle synthesis; diagnosis; therapeutic agent; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel multiplex amplification reaction for detecting clinically relevant fungal infections by amplifying a region of the 18S RNA gene, where only sequences from pathogenic Candida and Aspergillus species are amplified. The method is quick, simple and sensitive, and can detect all clinically important Candida and Aspergillus species, but generally it does not detect species commonly present in laboratories as contaminants (avoiding false positive results). The detection limit is 3-20 cells/10 ml of blood, depending on the detection method used. This sequence represents a PCR primer used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Multiplex amplification for detecting fungal infection, selective for clinically important strains of Candida and Aspergillus, comprises amplifying a region of the 18S RNA gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present sequence represents an oligonuclectide used in an example of the present invention. The present invention describes a method for synthesising a selected oligonuclectide (I) having well defined ends. The method comprises: (a) annealing a primer to a single-stranded (ss) circular template to yield a primed circular template, where the template comprises: (i) at least one nucleotide sequence complementary to (I); and (I) at least one nucleotide effective to produce a cleavage site in the oligonucleotide multimer; (b) combining the primed circular template with at least two types of nucleotide triphosphates and a polymerase enzyme without the addition of auxiliary proteins to yield a ss oligonucleotide wilthout the addition of auxiliary proteins to yield a so oligonucleotide unltimer complementary to the circular oligonucleotide template, comprising multiple copies of (I); and (o) cleaving the oligonucleotide multimer at the cleavage site to produce (I) having well defined ends. The method is used for the large-scale synthesis of DNA and RNA oligomers
                                                                                                                                                                                            ö
comprising multiple copies of (I); and (c) cleaving the oligonucleotide multimer at the cleavage site to produce (I) having well defined ends. The method is used for the large-scale synthesis of DNA and RNA oligomers for use, e.g. as probes and diagnostic agents and/or therapeutic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Rolling circle synthesis of oligo:nucleotide(s) - using primed circular template to produce oligonucleotide multimer for cleavage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         method is used for the large-scale synthesis of DNA and RNA oligome.

The present sequence represents an oligonuclectide used in an example of the present invention. The present invention describes a method for synthesising a selected oligonuclectide (I) having well defined ends. The method comprises: (a) annealing a primer to a single-stranded (ss) circular template to yield a primed circular template, where the template comprises: (i) at least one nuclectide sequence complementary to (I); and (ii) at least one nuclectide effective to produce a cleavage site in the oligonuclectide multimer; (b) combining the primed circular template with a least two types of nuclectide triphosphates and a polymerase enzyme without the addition of auxiliary proteins to yield a so oligonuclectide multimer complementary to the circular oligonuclectide template, comprising multiple copies of (I); and (C) cleaving the oligonuclectide multimer at the cleavage site to produce (I) having well defined ends. The method is used for the large-scale synthesis of DNA and RNA oligomers for use, e.g. as probes and diagnostic agents and/or therapeutic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rolling circle synthesis of oligo:nucleotide(s) - using primed circular template to produce oligonucleotide multimer for cleavage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  03-SEP-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Kool ET
   The present sequence represents an oligonucleotide used in an example of the present invention. The present invention describes a method for Synthesising a selected oligonucleotide (I) having well defined ends. The method comprises: (a) annealing a primer to a single-stranded (ss) circular template to yield a primed circular template, where the template comprises: (i) at least one nucleotide sequence complementary to (I); and (ii) at least one nucleotide effective to produce a cleavage site in the oligonucleotide multimer; (b) combining the primed circular template with at least two types of nucleotide triphosphates and a polymerase enzyme at least two types of nucleotide triphosphates and a polymerase enzyme without the addition of auxiliary proteins to yield a ss oligonucleotide wiltimer complementary to the circular oligonucleotide template, comprising multiple copies of (I); and (c) cleaving the oligonucleotide multimer at the cleavage site to produce (I) having well defined ends.

The method is used for the large-scale synthesis of DNA and RNA oligomers from the mathematic formulation of the large-scale synthesis of DNA and RNA oligomers.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Rolling circle synthesis of oligo:nucleotide(s) - using primed circular template to produce oligonucleotide multimer for cleavage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   use, e.g. as probes and diagnostic agents and/or therapeutic agents
                                                                   Synthesis, selection, amplification, circular oligonucleotide, rolling circle synthesis; diagnosis; therapeutic agent; ss.

The oligomer sequence ID No.46 was used in an example of the invention for synthesising an RNA oligonucleotide, comprising combining a singlestranded circular oligonucleotide template comprising combining a single-of a nucleotide sequence complementary to the sequence of the desired RNA oligonucleotide with at least 2 types of ribonucleotide triphosphate and a polymerase enzyme to yield a single-stranded RNA oligonucleotide multimer complementary to the circular oligonucleotide template, where the RNA oligonucleotide multimer comprises multiple copies of the desired RNA oligonucleotide. The methods can be used for producing RNA oligonucleotides having a specific sequence and well defined ends. The RNA oligonucleotides produced can be used as probes, standards and diagnostic or therapeutic agents. They can be used for modifying the structure or function of a target molecule. They can also be used to cleave disease-associated RNA, DNA or protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Revised record issued on 21-OCT-2004 : Correction to feature table key

ö
multimer complementary to the circular oligonucleotide template, where the RNA oligonucleotide multimer comprises multiple copies of the desired RNA oligonucleotide. The methods can be used for producing RNA oligonucleotides having a specific sequence and well defined ends. The RNA oligonucleotides produced can be used as probes, standards and diagnostic or therapeutic agents. They can be used for modifying the structure or function of a target molecule. They can also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              multimer, comprising multiple contiguous copies of a repeated oligonucleotides. The detectably labelled oligonucleotide multimer is useful for detecting a target molecule. Oligonucleotide multimers may be produced in sufficient quantity to be useful for diagnostic and medical applications. The multimers are useful for affinity labelling of proteins, and for signal amplification in highly sensitive affinity a faster, cheaper and sequence identification applications. The method provides a faster, cheaper and simpler way for large-scale production of DNA and RNA oligomers and multimers. The incorporation of labels enables the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              oligonucleotide multimers to be useful in diagnostics and medicine. The invention relates to a method for synthesising an RNA cligonuclectide template with at least two types of ribonuclectide template with at least two types of ribonuclectide template with at least two types of ribonuclectide triphosphate and a polymerase enzyme to yield a single-stranded RNA cligonuclectide multimer complementary to the circular oligonuclectide RNA oligonuclectide multimer comprises multiple copies of the desired RNA oligonuclectide with well-defined ends. The method is useful for synthesising an RNA oligonuclectide with well-defined ends. The circular oligonuclectide is introduced into the cell using direct injection, allocation cation-mediated delivery. The method is useful for treating bacterial and/or viral infections in mammals, particularly drug resistant infections and for producing double stranded DNA oligomers. The method is performed in the absence of an oligonuclectide primer, or without the addition of auxiliary proteins. This sequence represents an
                                                                                                                                                                                                                                                     RNA oligonucleotide synthesis; ribonucleotide triphosphate; polymerase; electroporation; calcium phosphate treatment; lipid-mediated delivery; cation-mediated delivery; bacterial infection; viral infection; drug resistant infection; double stranded DNA oligomer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthesizing RNA oligonucleotide involves combining single-stranded circular oligonucleotide, ribonucleotide triphosphate and polymerase enzyme to yield desired RNA complementary to circular oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

oligonuclectide, comprising combining a single-stranded circular cligonuclectide, comprising combining a single-stranded circular cligonuclectide template with at least two types of ribonuclectide template with at least two types of ribonuclectide cripopal polymerase enzyme to yield a single-stranded RNA oligonuclectide multimer comprises multiple complementary to the circular oligonuclectide multimer comprises multiple copies of the desired RNA oligonuclectide. The method is useful for copies of the desired RNA oligonuclectide with well-defined ends. The circular oligonuclectide is introduced into the cell using direct injection, calcitum phosphate treatment, lipid-mediated delivery, or cation-mediated delivery. The method is useful for treating bacterial and/or viral infections in mammals, particularly drug resistant infections, and for producing double stranded DNA oligoners. The method is performed in the absence of an oligonucleotide primer, or without the addition of auxiliary proteins. This sequence represents an cligonucleotide used in the method of the invention.
                                                                                                                                                                                                 RNA oligonucleotide synthesis, ribonucleotide triphosphate; polymerase, electropozation; calcium phosphate treatment; lipid-mediated delivery; cation-mediated delivery; bacterial infection; viral infection; drug resistant infection; double stranded DNA oligomer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Synthesizing RNA oligonucleotide involves combining single-stranded circular oligonucleotide, ribonucleotide triphosphate and polymerase enzyme to yield desired RNA complementary to circular oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      56.0%; Score 14; DB 10; Length 49; 63.6%; Pred.
